**3 Blockchain Ledger Platform**

**4 Case Study for Landing Gear**

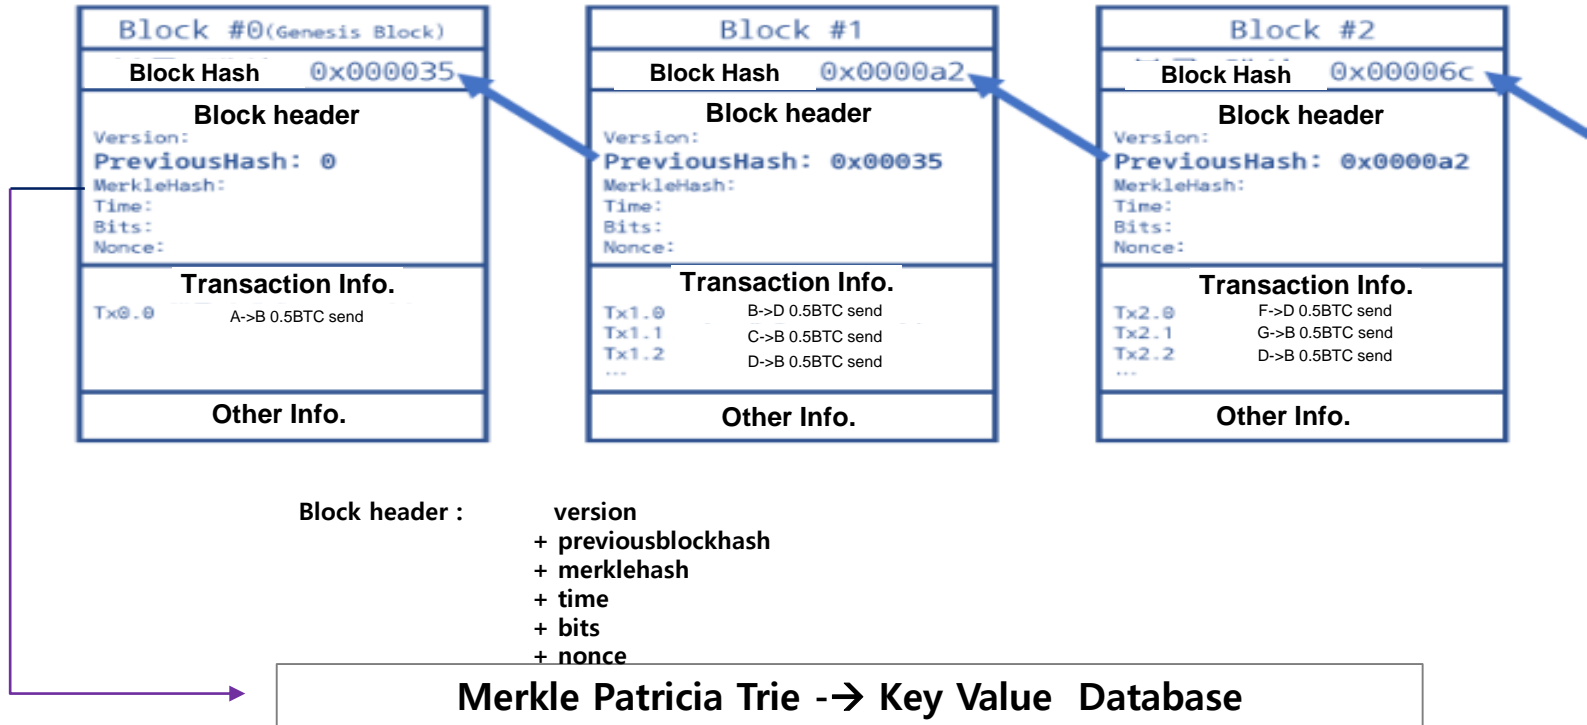

**1** **Blockchain Application in Aircraft MRO Industry**

2 DID(Distributed ID) and Credential

3 Blockchain Ledger Platform

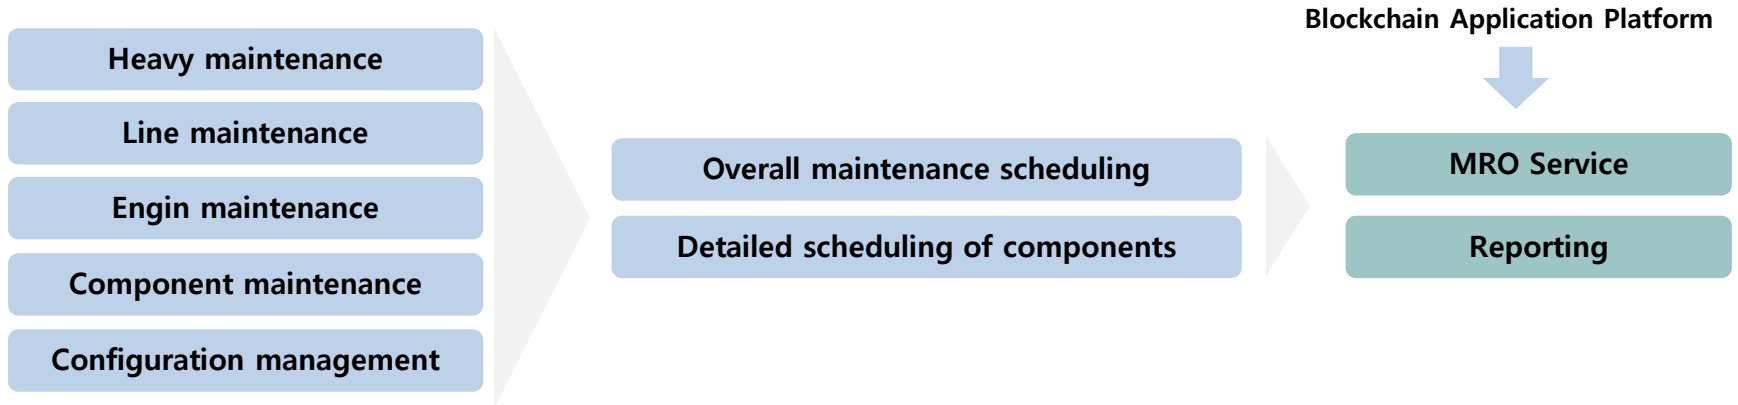

4 Case Study for Landing Gear

- Shape of Blockchain

- **Properties of Blockchain**
  - Irreversibility
  - Information symmetry among network nodes
  - Public chain vs. private chain by DID(Distributed ID)
  - Token generation (included within private chain)
- **Current trends of Blockchain technology**
  - Speed : block creation & finality
  - Storage : needs new concept to store old data outside
  - Multi-blockchain: imitates the legacy DB functionalities
  - DID: Self sovereign ID and universal classification method including users, network, IoT, component, document and so on.
  - Block consensus :PoW, PoS, BFT

- **Major Problems to be solved**
  - **Closed operation of MRO service among participants**
  - **Difficult traceability in Components including Life Limited Part**
  - **Limited sharing of document by relevant users**
  - **Burdensome document generation**
  - **Non-communicative document storage**

- **Advantages by blockchain technology**
  - **Open operation of MRO service among participants**
  - **Easy traceability in components and their history**
  - **Open sharing of document by relevant users**
  - **Fast document generation**
  - **Communicative tools for document storage**

**2 DID(Distributed ID) and Credential**

3 Blockchain Ledger Platform

4 Case Study for Landing Gear

# DID - Actors - DID & Credential Issuer

DIDs for organization ID should be issued by IATA Task Group commonly and component ID are issued by authorized manufacturers when component comes out to the commercial market. All relevant documents relating to MRO service, credentials, can have the credential ID. Component ID plays a key to retrieve the all activity data of MRO service.

**Player**

**Blockchain Ledger Data**

**Storage Data**

**Organization ID Issuer**

- IATA
- IATA MCG

- Airline MRO Unit ID
- MRO company ID
- Supervisor ID
- Certified Engineer ID

- Airline MRO Unit –Detailed Info.
- MRO company –Detailed info.
- Supervisor –Detailed info.
- Certified Engineer –Detailed info.

**Component ID Issuer**

- Boeing
- Airbus

- Aircraft Model
- MSN
- Registration Number
- Engine Type
- ESN
- Engine Position
- APU Type
- APU SN
- Nose Landing Gear PN/SN
- Main Landing Gear RH PN/SN
- Main Landing Gear LH PN/SN
- Detailed Part Information

**Credential Issuer**

- Airline MRO
- Independent MRO

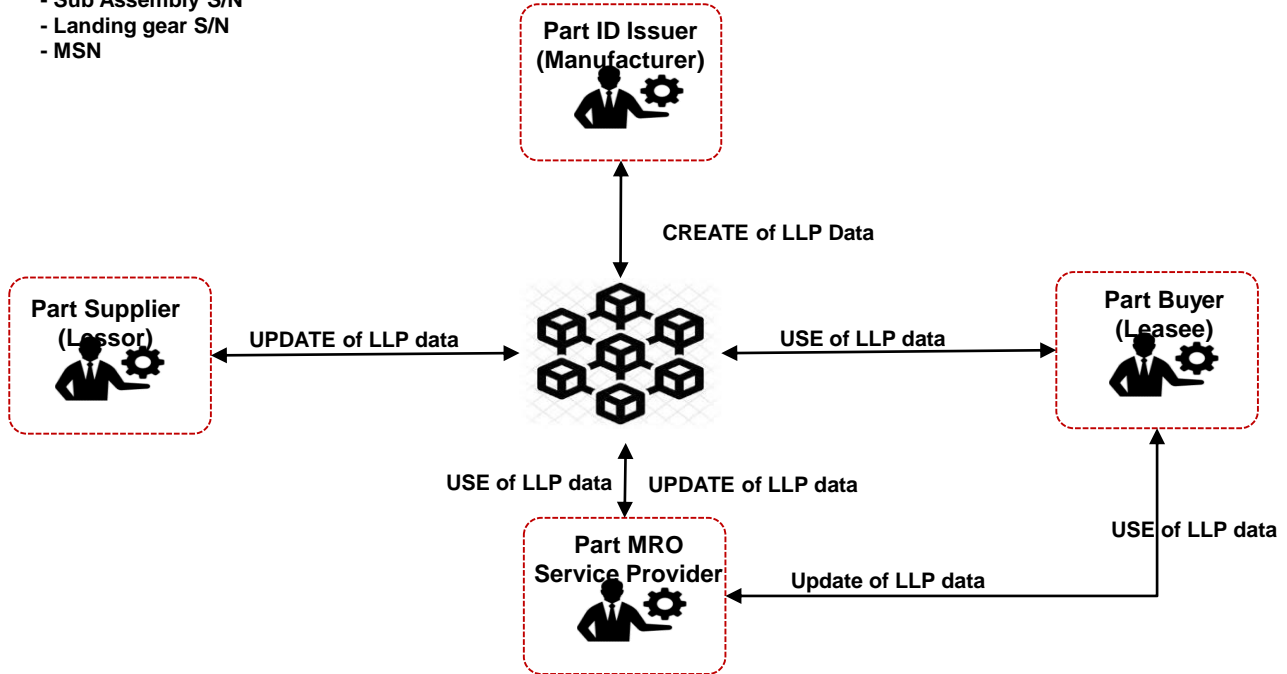

- Document(Credential) ID
- Document Length
- Document Hash
- Document format Number
- State
- Issuer ID
- Reference Code : Document Hash
- Starting Date
- Ending Date
- Issuer Signature
- Authorized Release Certificate
- LLP Removal & Installation
- Life Limited Part Status Sheet
- Aircraft Equipment List Report

# DID - Actions – LLP Data Create/Update/Use

LLP data is created by LLP manufacturer and is maintained by supplier, buyer and MRO service provider. All of data manipulation is recorded into Distributed Ledger and any errored input should be reentered to trace the activity history.

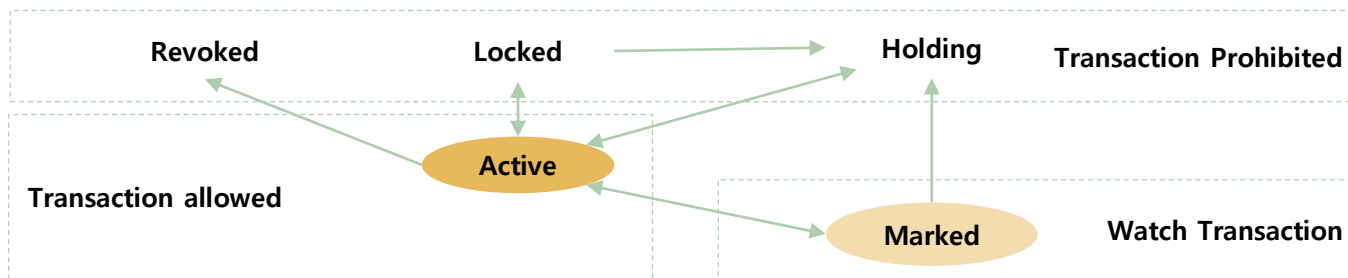

- LLP Data for Data with DID and Action (S/N, Total Hour , Total Cycle)
  - Minimal LLP S/N
  - Sub Assembly S/N
  - Landing gear S/N
  - MSN

# DID

- User : DID : Credential = 1 : 1 : n
- Additional Credential issue & update is only executed by CA which issue the current DID
- DID is recorded on the block by CA on the request of wallet.

	DID Issue	Issuer Verifier	Credential				
			Issue	Update	Locked	Revoked	Marked
Private CA	O	O	O	O	O	O	O
Public CA	O	X	O	X	O	O	O

**DID = 10 bytes**

DID Example	
Master CA's 1 <sup>st</sup> Credential	0x0001 000000000001 0002
Master CA's 2 <sup>nd</sup> Credential	0x0001 000000000001 0003
1 <sup>st</sup> CA's 1 <sup>st</sup> Credential	0x0002 000000000001 0002
1 <sup>st</sup> CA's 2 <sup>nd</sup> Credential	0x0002 000000000001 0003
1 <sup>st</sup> CA's 1 <sup>st</sup> User's 1 <sup>st</sup> Credential	0x0002 XXXXXXXXXXXX 0002
1 <sup>st</sup> CA's 1 <sup>st</sup> User's 2 <sup>nd</sup> Credential	0x0002 XXXXXXXXXXXX 0003
1 <sup>st</sup> CA's 2 <sup>nd</sup> User's 1 <sup>st</sup> Credential	0x0002 YYYYYYYYYYYY 0002

- Every user has **unique DID with multiple credentials**
- DID is created by CA(Certified Access) node and consist of **10 byte** random number, which guarantees **the singularity and integrity**,
- Transactions on the blockchain are **written with DID** so that the storage capability would be enhanced, while existing blockchain platforms use **20-byte public key** for transactions.
- An user can create ID and all Credentials by using smart wallet.
- DID and all Credentials are written on ID blockchain.
- Private key is stored in the smart wallet safely placed into the key store.

## DID consists of 10 bytes.

- **Version (2bit)**
- **Citizen ID (CA ID 14 bit + random 6 Bytes)**  
 =  $256 * 256 * 256 * 256 * 256 * 256$   
 = 281,474,980,000,000 accounts  
 = IATA User ID  
 = Certified and Trusted ID
- **Sequence Number (2 Bytes)**

B: Byte(s) b:bit(s)

SSII (Self Sovereign Identity Information)				
Field		Size	Description	
DID	Version		2 b	0: version
	Citizen ID	CA ID	14 b	0x0001 : Master CA 0x0002 ~ 0x3FFF : CA
		Random	6 B	0x00...01:CA Random Number : general user (check duplicacy)
			2 B	1: General Credential 2 ~ : Basic Credential

## DID - Data Structure

---

- Credential contains public key, role, verification flag, state, credit, country, reference code, country, validity starting date, validity ending date.
- Issuer Signature (65B ECDSA encryption method)
- Role : classification of account usage
- State : account status

## ■ Structure of Basic Credential

- Public key = hashed key = account
- Role = role of CA node (cf) verisign
- Verification flag
- State : Account status
- Credit : data can be written by oraclizer
- Country

Credential (Basic)	PublicKeyHash	20 B	Hashed Public Key
	Role	2 B	0x0001: General 0xF0F0: Master CA 0xF0F1 : CA
	Verification Flag	3 b	Reserved
		1 b	Deposit
		1 b	Face to Face confirmation
		1 b	National Identity confirmation
		1 b	Mobile phone number confirmation
	1 b	E-mail confirmation	
	State	1 B	0x01: Active 0x02: Revoked 0x03: Locked 0x04: Hoding 0x05: Marked // IATA setting (Oracled transaction)
	Credit	1 B	Credit Grade // IATA setting (Oracled transaction)
Country	1 B	Country code	

## ▪ General Credential

- Document ID
- Document Length
- Document : format N bytes
- State
- Issuer ID
- Reference Code
- Starting date
- Ending date
- Issuer Signature

**Free Format**

**Trust Anchor**

**Validity**

## ▪ Role of General Credential( Document Format)

Field		Size	Description
SymID		10 B	
Credential (General)	DocID	20 B	Document ID
	Length	2 B	Document length
	Document	N B	{ Type : Doc or Format Format ID : DID.DocID Contents : { ... } }
	State	1 B	0x01 : Active, 0x02 : Revoked
	Issuer ID	10 B	Issuer DID
	Ref. code	4 B	Issuer reference (dApp ID, CA assign, Big data usage)
	NotBefore	8 B	Validity starting date // yyyyymmdd + (00:00:00), UTC+0
	NotAfter	8 B	Validity ending date // yyyyymmdd + (00:00:00), UTC+0
Issuer Signature		65 B

# Blockchain Ledger Platform – Required Properties

LLP data is created by LLP manufacturer and is maintained by supplier, buyer and MRO service provider. All of data manipulation is recorded into Distributed Ledger and any errored input should be reentered to trace the activity history.

## Required Platform Properties

### Minimality

- The least component in sub-assembly should be the index key of D/L
- Example – Main landing gear  
- Gear Shock Strut(2.1.1) –Inner Cylinder(2.1.2.3)

### Irreversibility

- Any data in D/L cannot be modified so that the D/L should automatically generate the scanner database in read-only mode.

### Integrity

- Any data and related document can be retrieved by use of the Aircraft MSN, Component P/N and S/N.

### Individuality

- LLP-related data should be retrieved by any hierarchical level of component.

### Traceability

- LLP can be traceable by the combinational data retrieval of both D/L and centralized scanner database.

### Deliverability

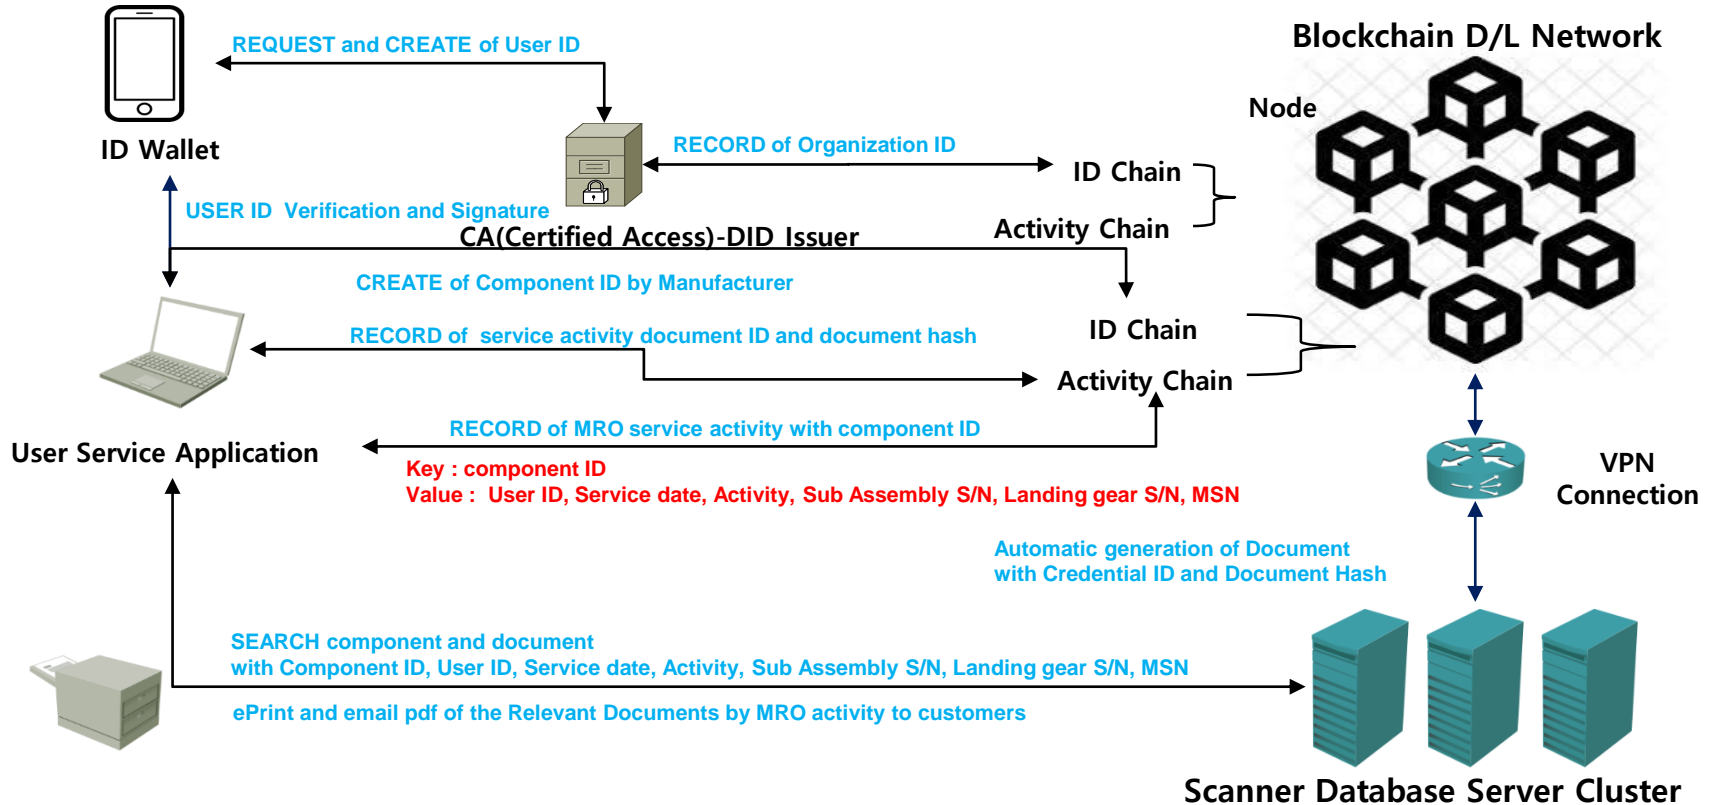

- DID wallet and HTML5 compliant user interface can automatically generate the relevant MRO activity documents from MRO service provider to interested parties including airline operator and others.

## Blockchain Distribute Ledger Platform – Structure and Characteristics

---

- **Blockchain D/L platform consists of D/L network nodes, ID issuer node and Scanner Database server cluster.**
- **These platform is basically private blockchain platform.**
- **ID Wallet requests ID issue to CA(Certified Access), after it generates Public Key and Private Key. ID wallet has a self sovereign ID that has no password to access platform .**
- **Blockchain D/L node has two blockchains including ID chain and Activity chain.**
- **Number of Blockchain D/L nodes can be extended from 7 nodes (at minimum) to 25 nodes at maximum.**
- **It is also possible to add one more blockchains for the further service activity needs like market transaction.**
- **Scanner database is automatically updated by the new data entry of blockchain D/L Activity chain.**
- **Relevant documents are generated by MRO users or Manufacturer based upon the D/L data, requested by the users such as airlines or MRO service providers or traders.**
